# Contact with experiment: fluctuations

X.-Luo and N.-Xu, Nucl. Sci. Tech. 28 (2017) no.8, 112 [arXiv:1701.02105 [nucl-ex]].

Quark chemical potentials related to those of conserved charges:

$$\mu_u = \mu_B/3 + 2\mu_Q/3$$

$$\mu_d = \mu_B/3 - \mu_Q/3$$

$$\mu_s = \mu_B/3 - \mu_Q/3 - \mu_S$$

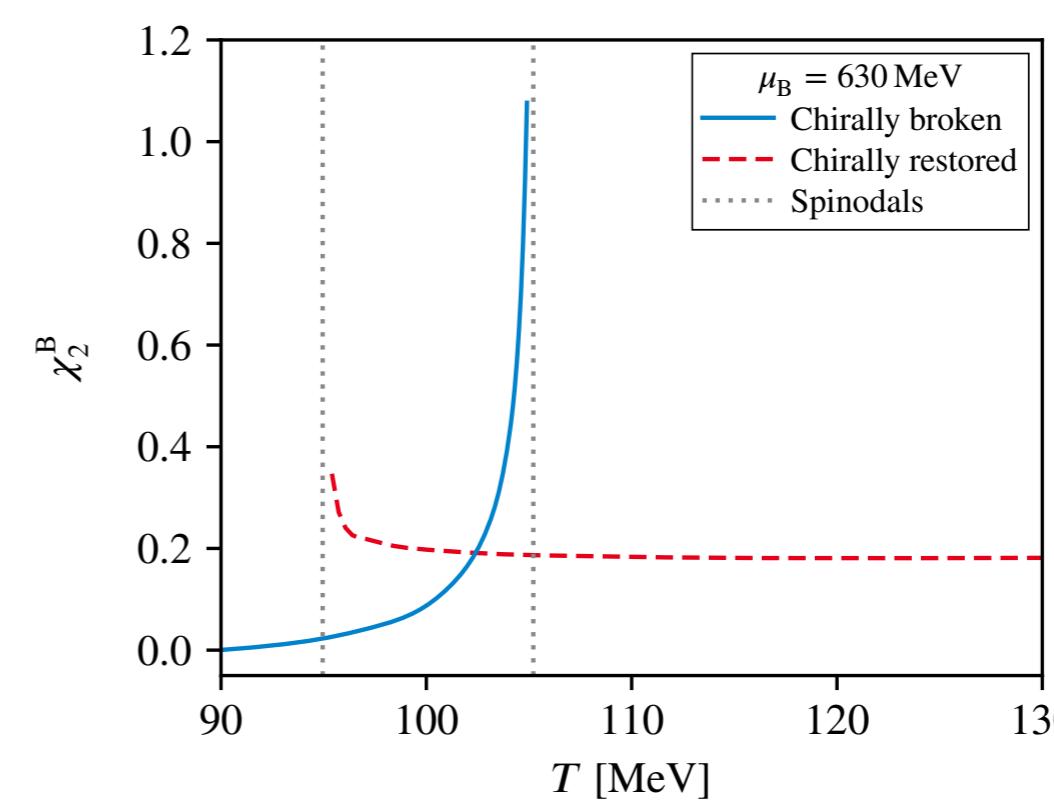

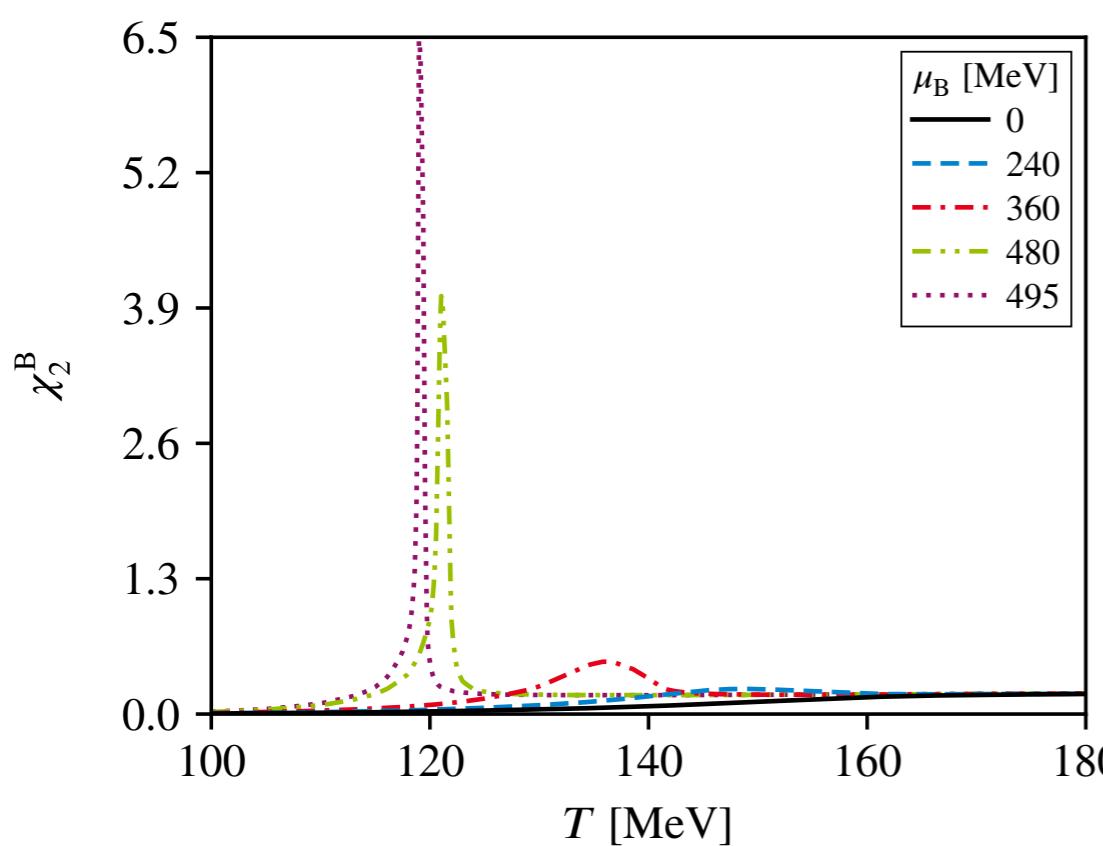

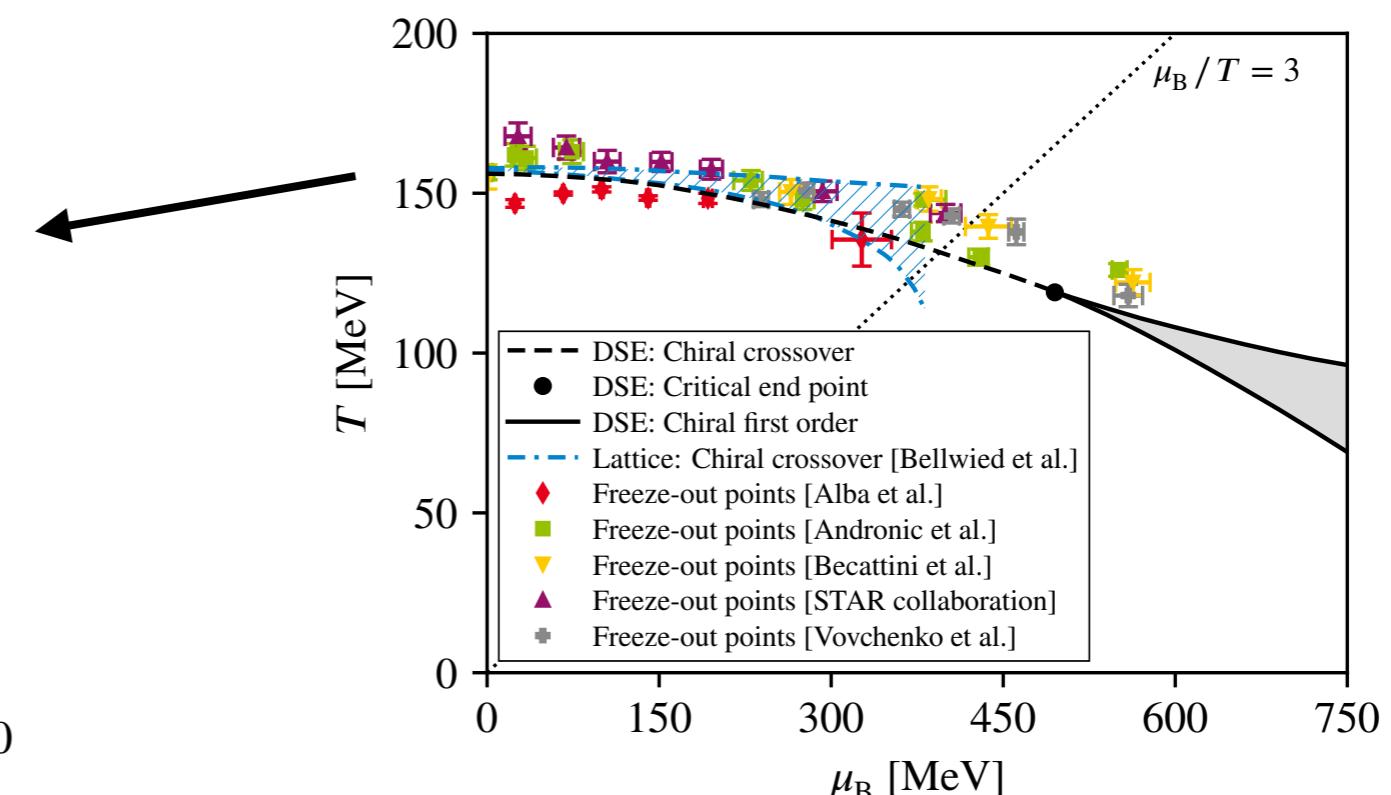

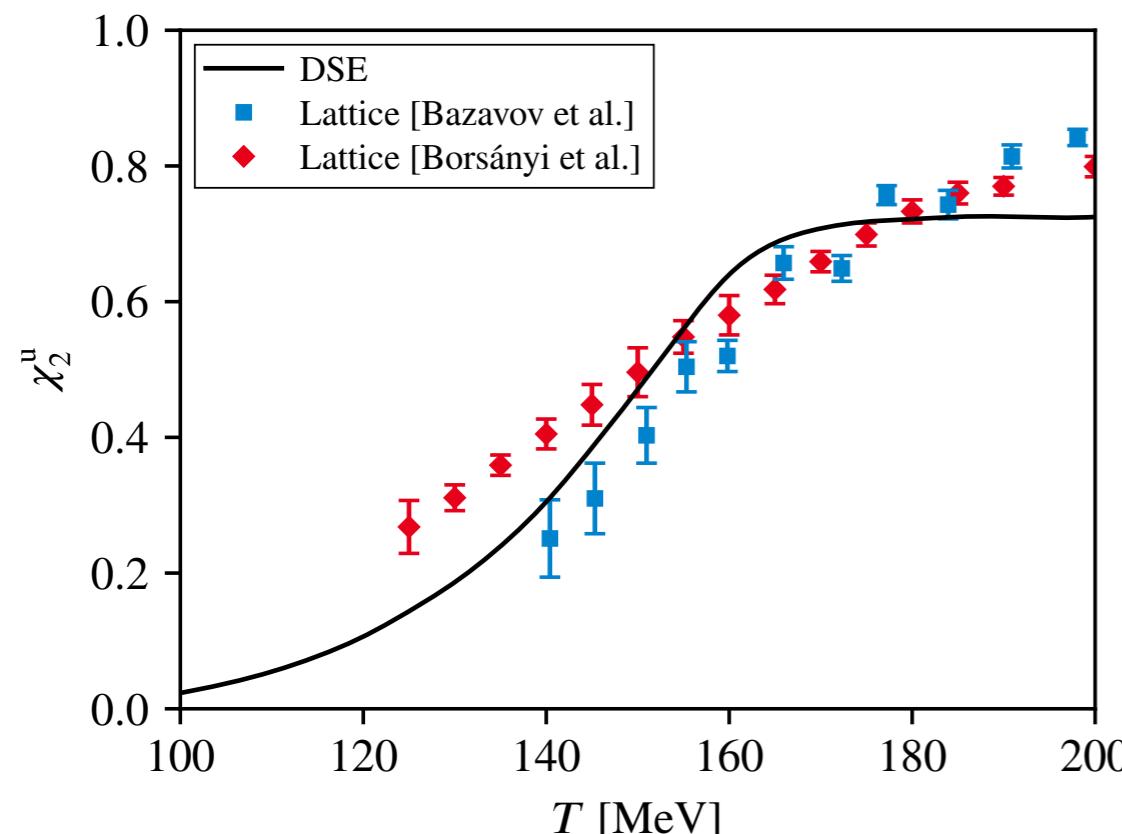

Serve to calculate susceptibilities:

$$\chi_{lmn}^{BSQ} = \frac{\partial^{l+m+n}(p/T^4)}{\partial(\mu_B/T)^l \partial(\mu_S/T)^m \partial(\mu_Q/T)^n}$$

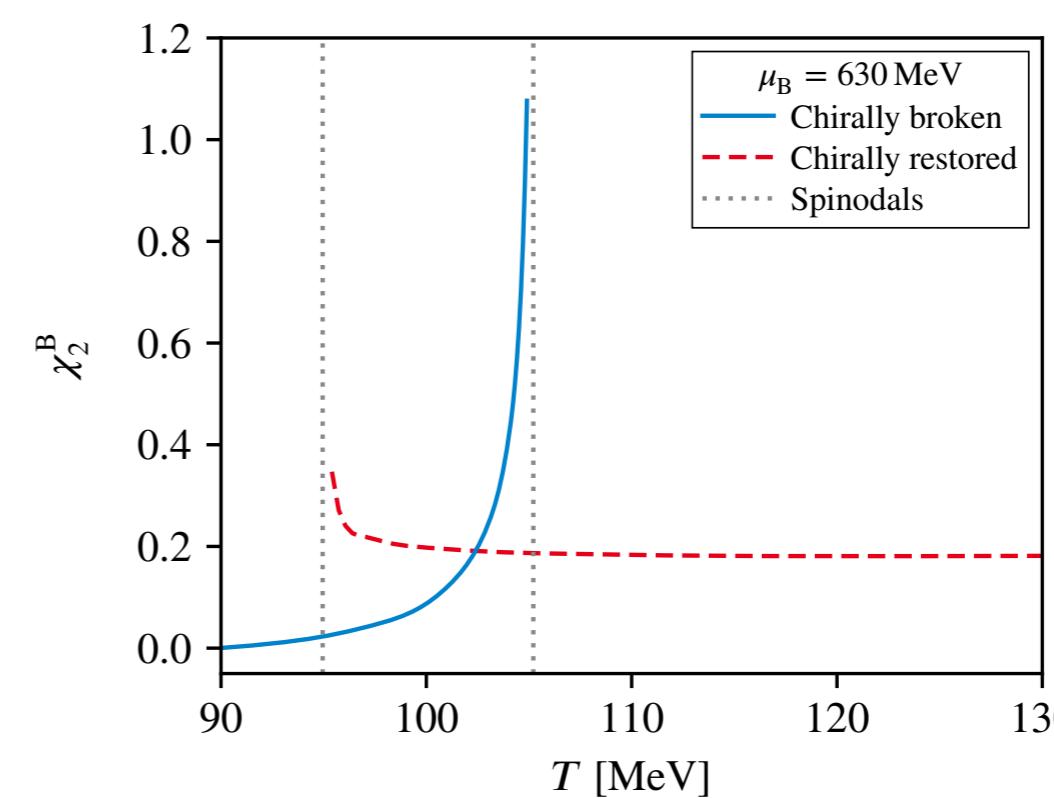

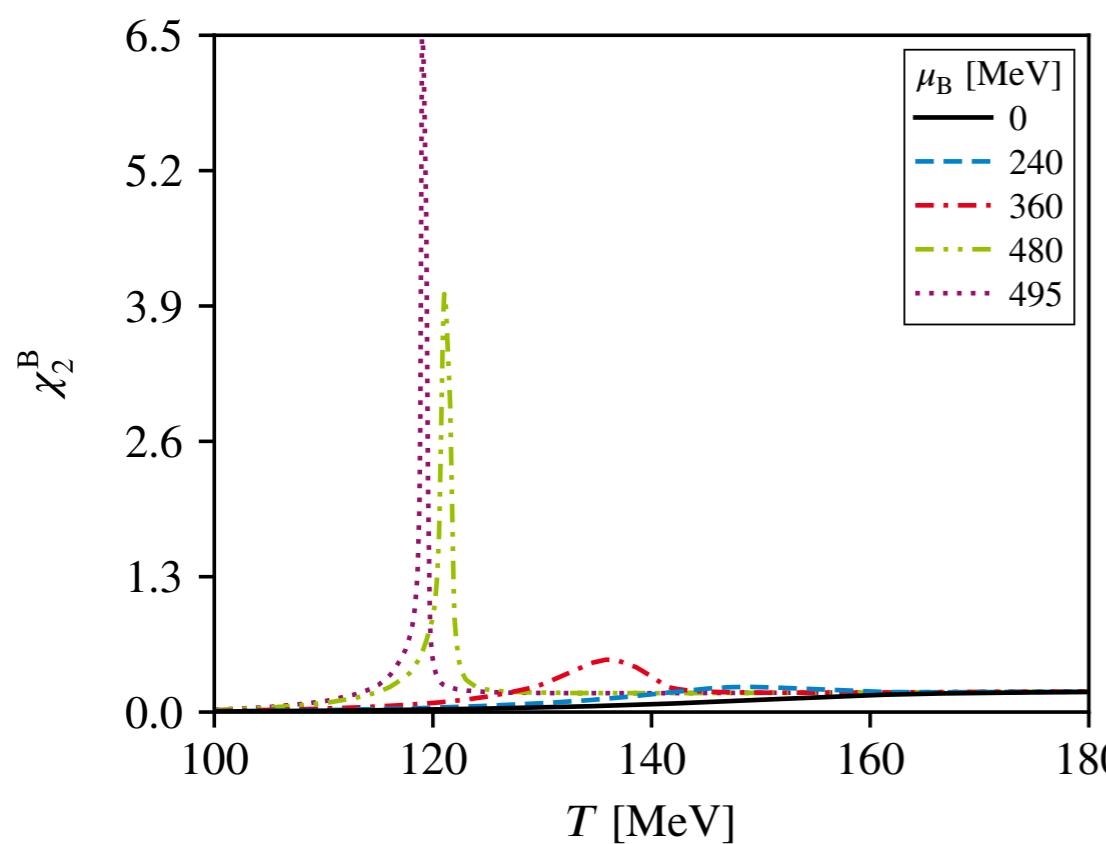

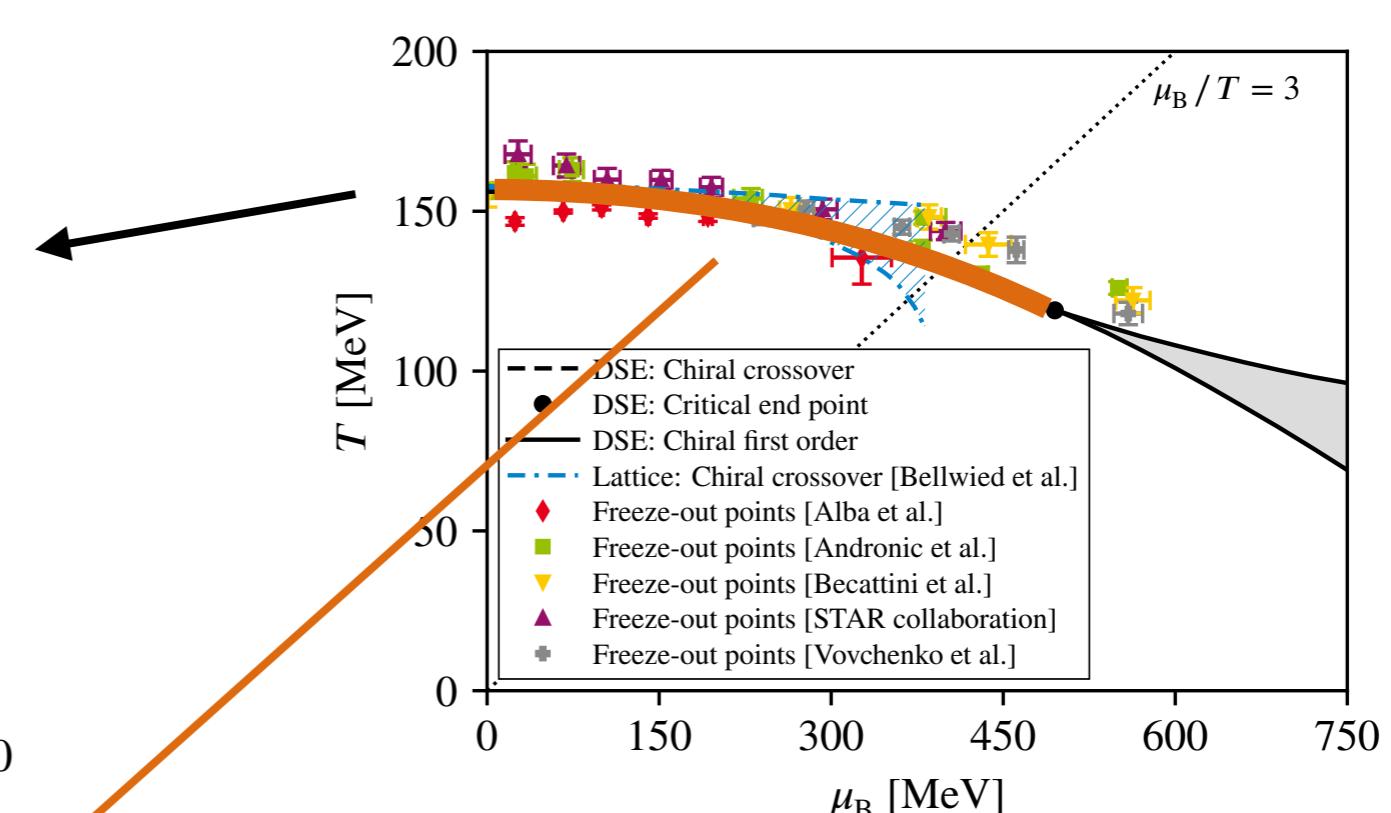

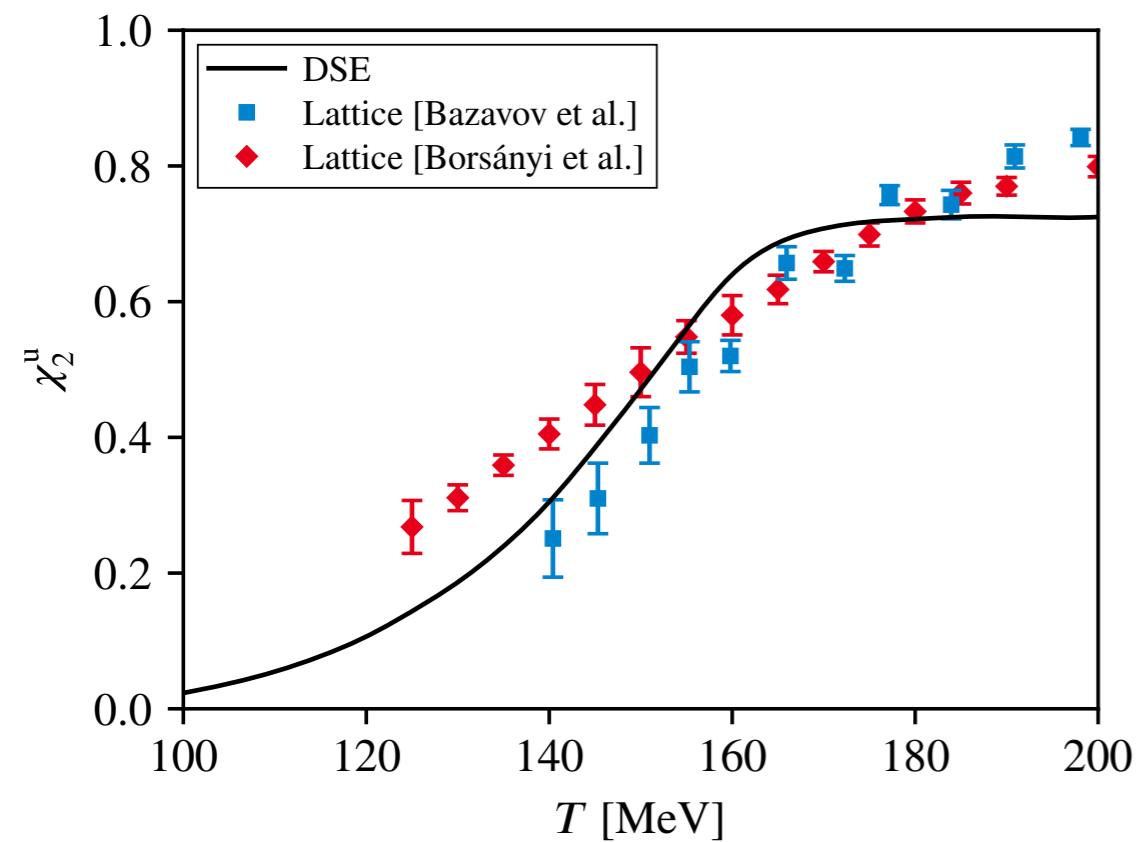

Related to cumulants, which can be extracted from experiment:

$$C_{lmn}^{BSQ} = VT^3 \chi_{lmn}^{BSQ}$$

# Summary: QCD with functional methods

## Main goals:

- **one framework for all areas of hadron physics:**  
mesons, baryons, ‘exotic states’, form factors,  
hadronic contributions to precision observables ( $g-2$ )
- **same framework for QCD phase diagram**

## Main challenge:

- systematic control over error budget:  
intrinsic, cp with FRG, cp with lattice QCD

## Main results:

- not high precision physics  
but competitive contributions in many areas
- **QCD-based tool to explore phase diagram at large  $\mu$   
at physical quark masses**
